Augmented Reality: Search and Rescue information display

Becker Avionics' Personal Locator Beacons (PLB) provide exact positions of people in distress. In this project, these position data of the persons to be rescued are to be displayed into the vision field of the rescue crews:

- Augmented Reality for dynamic information display
- Evaluation of the procedures for displaying visual aids with regard to their suitability for rescue crews
- Connection to Search and Rescue products
- MS HoloLens platform
- Program duration: six months

We are looking for:

- A Student of Applied Computer Science, Information Technology or other subject relating to Augmented Reality
- First experiences in Virtual Reality/ Augmented Reality development in Unity or comparable IDE
- Basic programming skills in C++, C#
- Good command of the English language, German is a plus

What we offer:

- Leading knowledge in the Avionics industry
- Insights into Development, production and Quality Management
- Pleasant work environment within an international SME
- Daily fresh fruits
